  int m2 = (A + B) / 2 + 1;
  if(f(m1) > f(m2))
    A = m1;
  else
    B = m2;
ans = inf;
for (int i = A; i \le B; i++) ans = min (ans , f(i));
```

7.2 Count Sort

```
int H[(1<<15)+1], to[mx], b[mx];
void sort(int m, int a[]) {
  memset(H, 0, sizeof H);
  for (int i = 1; i <= m; i++) H[a[i] % (1<<15)]++;
  for (int i = 1; i < 1<<15; i++) H[i] += H[i-1];
  for (int i = m; i; i--) to[i] = H[a[i] % (1 << 15)]--;</pre>
```

```
for (int i = 1; i <= m; i++) b[to[i]] = a[i];
memset(H, 0, sizeof H);
for (int i = 1; i <= m; i++) H[b[i]>>15]++;
for (int i = 1; i < 1<<15; i++) H[i] += H[i-1];
for (int i = m; i ; i--) to[i] = H[b[i]>>15]--;
for (int i = 1; i <= m; i++) a[to[i]] = b[i];</pre>
```

7.3 Random Number Generator

```
// mt19937_64 se LL
mt19937 rng(chrono::steady_clock::now().time_since_epoch().count());
// Random_Shuffle
shuffle(v.begin(), v.end(), rng);
// Random number in interval
int randomInt = uniform_int_distribution(0, i)(rng);
double randomDouble = uniform_real_distribution(0, 1)(rng);
// bernoulli_distribution, binomial_distribution, geometric_distribution
// normal_distribution, poisson_distribution, exponential_distribution
```

7.4 Rectangle Hash

```
namespace {
  struct safe_hash {
    static uint64_t splitmix64(uint64_t x) {
      // http://xorshift.di.unimi.it/splitmix64.c

   int x4 = min(x2, other.x2);
    int y4 = min(y2, other.y2);
   return rect (x3, y3, x4, y4);
  uint64_t get_hash() {
   safe hash sh:
   uint64_t ret = sh(x1);
   ret ^= sh(ret ^ y1);
   ret ^= sh(ret ^ x2);
    ret ^= sh(ret ^ y2);
   return ret;
};
```

7.5 Safe Hash

```
namespace {
    struct safe_hash {
        static uint64_t splitmix64(uint64_t x) {
            // http://xorshift.di.unimi.it/splitmix64.c
            x += 0x9e3779p97f4a7cl5;
            x = (x ^ (x >> 30)) * 0xbf58476dlce4e5b9;
            x = (x ^ (x >> 27)) * 0x94d049bb13311leb;
```

7.6 Unordered Map Tricks

```
// pair<int, int> hash function
struct HASH(
    size_t operator()(const pair<int,int>&x)const(
    return (size_t) x.first * 37U + (size_t) x.second;
};
unordered_map<int,int>mp;
mp.reserve(1024);
mp.max_load_factor(0.25);
```

7.7 Iterate masks in bitcount order

```
for(int k = n-1; k >= 0; k--) {
  unsigned int i = (1 << k) -1;
  while(i < (1 << n)) {
    // do what you want
    unsigned int t = (i | (i - 1)) + 1;
    if(i == 0) break;
    i = t | ((((t & -t) / (i & -i)) >> 1) - 1);
    }
}
```

7.8 Submask Enumeration

```
for (int s=m; ; s=(s-1)&m) {
    ... you can use s ...
    if (s==0) break;
}
```

7.9 Sum over Subsets DP

```
// F[i] = Sum of all A[j] where j is a submask of i
for(int i = 0; i < (1 < < N); ++i)
   F[i] = A[i];
for(int i = 0; i < N; ++i) for(int mask = 0; mask < (1 < < N); ++mask) {
   if(mask & (1 < < i))
        F[mask] += F[mask^(1 < < i)];
}</pre>
```

7.10 Dates

```
string dayOfWeek[] = {"Mon", "Tue", "Wed", "Thu", "Fri", "Sat", "Sun"};
// converts Gregorian date to integer (Julian day number)
int dateToInt (int m, int d, int y) {
    return
        1461 * (y + 4800 + (m - 14) / 12) / 4 +
        367 * (m - 2 - (m - 14) / 12 * 12) / 12 -
        3 * ((y + 4900 + (m - 14) / 12) / 100) / 4 +
        d - 32075;
}
```

```
// converts integer (Julian day number) to Gregorian date: month/day/year
void intToDate (int jd, int &m, int &d, int &y) {
   int x, n, i, j;

   x = jd + 68569;
   n = 4 * x / 146097;
   x -= (146097 * n + 3) / 4;
   i = (4000 * (x + 1)) / 1461001;
   x -= 1461 * i / 4 - 31;
   j = 80 * x / 2447;
   d = x - 2447 * j / 80;
   x = j / 11;
   m = j + 2 - 12 * x;
   y = 100 * (n - 49) + i + x;
}

// converts integer (Julian day number) to day of week
string intToDay (int jd) {
   return dayOfWeek[jd % 7];
}
```

7.11 Regular Expressions

```
import java.util.*;
import java.util.regex.*;

public class Main {
    public static String BuildRegex () {
        return "^" + sentence + "$";
    }

    public static void main (String args[]) {
        String regex = BuildRegex();
        // check pattern documentation
        Pattern pattern = Pattern.compile (regex);
        Scanner s = new Scanner(System.in);
        String sentence = s.nextLine().trim();
        boolean found = pattern.matcher(sentence).find()
    }
}
```

7.12 Lat Long

```
Converts from rectangular coordinates to latitude/longitude and vice
versa. Uses degrees (not radians).
struct 11
  double r, lat, lon;
};
struct rect
  double x, y, z;
11 convert(rect& P)
 11 Q;
  Q.r = sqrt(P.x*P.x+P.y*P.y+P.z*P.z);
  Q.lat = 180/M_PI*asin(P.z/Q.r);
  Q.lon = 180/M_PI*acos(P.x/sqrt(P.x*P.x+P.y*P.y));
  return Q;
rect convert (ll& Q)
  P.x = Q.r*cos(Q.lon*M_PI/180)*cos(Q.lat*M_PI/180);
  P.y = Q.r*sin(Q.lon*M_PI/180)*cos(Q.lat*M_PI/180);
  P.z = Q.r*sin(Q.lat*M_PI/180);
  return P;
```

7.13 Stable Marriage

```
std::vector<std::vector<int>> stableMarriage(std::vector<std::vector<int>> first, std
     ::vector<std::vector<int>> second, std::vector<int> cap) {
        assert(cap.size() == second.size());
        int n = (int) first.size(), m = (int) second.size();
        // if O(N * M) first in memory, use table
        std::map<std::pair<int, int>, int> prio;
        std::vector<std::set<std::pair<int, int>>> current(m);
        for (int i = 0; i < n; i++) {
                std::reverse(first[i].begin(), first[i].end());
        for (int i = 0; i < m; i++) {
                for(int j = 0; j < (int) second[i].size(); j++) {</pre>

    while (curr_r < q.r) {</pre>
      curr_r++;
      add(curr_r);
    while (curr 1 < q.1) {
      remove(curr_1);
      curr_l++;
    while (curr_r > q.r) {
      remove (curr_r);
      curr r--:
    ans[q.idx] = diff;
```

Teoremas e formulas uteis

8.1 Grafos

```
Formula de Euler: V - E + F = 2 (para grafo planar)
Handshaking: Numero par de vertices tem grau impar
Kirchhoff's Theorem: Monta matriz onde Mi,i = Grau[i] e Mi,j = -1 se houver aresta i-j
      ou O caso contrario, remove uma linha e uma coluna qualquer e o numero de
     spanning trees nesse grafo eh o det da matriz
Grafo contem caminho hamiltoniano se:
Dirac's theorem: Se o grau de cada vertice for pelo menos n/2
Ore's theorem: Se a soma dos graus que cada par nao-adjacente de vertices for pelo
Boruvka's: enquanto grafo nao conexo, para cada componente conexa use a aresta que sai
      de menor custo.
Trees.
Tem Catalan(N) Binary trees de N vertices
Tem Catalan (N-1) Arvores enraizadas com N vertices
Caley Formula: n^(n-2) arvores em N vertices com label
Prufer code: Cada etapa voce remove a folha com menor label e o label do vizinho eh
     adicionado ao codigo ate ter 2 vertices
Recuperar min cut eh ver se level[u] != -1 ai eh do lado do source
Max Edge-disjoint paths: Max flow com arestas com peso 1
Max Node-disjoint paths: Faz a mesma coisa mas separa cada vertice em um com as
     arestas de chegadas e um com as arestas de saida e uma aresta de peso 1
     conectando o vertice com aresta de chegada com ele mesmo com arestas de saida
Koniq's Theorem: minimum node cover = maximum matching se o grafo for bipartido,
     complemento eh o maximum independent set
Min vertex cover sao os vertices da particao do source que nao tao do lado do source
     do cut e os do sink que tao do lado do source, independent set o contrario
Min edge cover eh N - match, pega as arestas do match mais qualquer aresta dos outros
     vertices
Min Node disjoint path cover: formar grafo bipartido de vertices duplicados, onde
     aresta sai do vertice tipo A e chega em tipo B, entao o path cover eh N -
     matching
Min General path cover: Mesma coisa mas colocando arestas de A pra B sempre que houver
      caminho de A pra B
Dilworth's Theorem: Min General Path cover = Max Antichain (set de vertices tal que
     nao existe caminho no grafo entre vertices desse set)
Hall's marriage: um grafo tem um matching completo do lado X se para cada subconjunto
    W de X,
    |W| \le |vizinhosW| onde |W| eh quantos vertices tem em W
feasible flow in a network with both upper and lower capacity constraints, no source
     or sink: capacities are changed to upper bound - lower bound. Add a new source
```

and a sink. let M[v] = (sum of lower bounds of ingoing edges to v) - (sum of lower bounds of outgoing edges from v). For all v, if M[v] > 0 then add edge (S,v) with capcity M, otherwise add (v,T) with capacity M. If all outgoing edges from S are full, then a feasible flow exists, it is the flow plus the original lower bounds

8.2 Math

```
Goldbach's: todo numero par n > 2 pode ser representado com n = a + b onde a e b sao
Twin prime: existem infinitos pares p, p + 2 onde ambos sao primos
Legendre's: sempre tem um primo entre n^2 e (n+1)^2
Lagrange's: todo numero inteiro pode ser inscrito como a soma de 4 quadrados
Zeckendorf's: todo numero pode ser representado pela soma de dois numeros de
     fibonnacis diferentes e nao consecutivos
Euclid's: toda tripla de pitagoras primitiva pode ser gerada com
    (n^2 - m^2, 2nm, n^2+m^2) onde n, m sao coprimos e um deles eh par
Wilson's: n eh primo quando (n-1)! mod n = n - 1
Mcnugget: Para dois coprimos x, y o maior inteiro que nao pode ser escrito como ax +
     by eh (x-1)(y-1)/2
Fermat: Se p eh primo entao a^(p-1) % p = 1
Se x e m tambem forem coprimos entao x^k % m = x^(k \mod(m-1)) % m
Euler's theorem: x^{(phi(m))} \mod m = 1 onde phi(m) eh o totiente de euler
Chinese remainder theorem:
Para equacoes no formato x = a1 \mod m1, ..., x = an \mod mn onde todos os pares m1,
      ..., mn sao coprimos
Deixe Xk = m1 * m2 * .. * mn/mk e Xk^-1 mod mk = inverso de Xk mod mk, entao
x = \text{somatorio com } k \text{ de } 1 \text{ ate } n \text{ de } ak \times Xk \times (Xk, mk^-1 \text{ mod mk})
Para achar outra solucao so somar m1*m2*..*mn a solucao existente
Catalan number: exemplo expressoes de parenteses bem formadas
C0 = 1, Cn = somatorio de <math>i=0 \rightarrow n-1 de Ci*C(n-1+1)
outra forma: Cn = (2n \text{ escolhe } n)/(n+1)
Bertrand's ballot theorem: p votos tipo A e q votos tipo B com p>q, prob de em todo
     ponto ter mais As do que Bs antes dele = (p-q)/(p+q)
Se puder empates entao prob = (p+1-q)/(p+1), para achar quantidade de possibilidades
     nos dois casos basta multiplicar por (p + q escolhe q)
Propriedades de Coeficientes Binomiais:
Somatorio de k = 0 -> m de (-1)^k * (n escolhe k) = (-1)^m * (n -1 escolhe m)
(N \text{ escolhe } K) = (N \text{ escolhe } N-K)
(N \text{ escolhe } K) = N/K * (n-1 \text{ escolhe } k-1)
Somatorio de k = 0 \rightarrow n de (n escolhe k) = 2^n
Somatorio de m = 0 \rightarrow n de (m = scolhe k) = (n+1 = scolhe k + 1)
Somatorio de k = 0 -> m de (n+k \text{ escolhe } k) = (n+m+1 \text{ escolhe } m)
Somatorio de k = 0 \rightarrow n de (n escolhe k)^2 = (2n escolhe n)
Somatorio de k = 0 ou 1 \rightarrow n de k*(n escolhe k) = n * 2^(n-1)
Somatorio de k = 0 \rightarrow n de (n-k) escolhe k = Fib(n+1)
Hockey-stick: Somatorio de i = r \rightarrow n de (i = scolhe r) = (n + 1 = scolhe r + 1)
Vandermonde: (m+n \text{ escolhe } r) = \text{somatorio de } k = 0 \rightarrow r \text{ de } (m \text{ escolhe } k) \star (n \text{ escolhe } r)
       - k)
Burnside lemma: colares diferentes nao contando rotacoes quando m = cores e n =
     comprimento
(m^n + somatorio i = 1 - > n-1 de m^qcd(i, n))/n
Distribuicao uniforme a, a+1, ..., b Expected[X] = (a+b)/2
Distribuicao binomial com n tentativas de probabilidade p, X = sucessos:
    P(X = x) = p^x * (1-p)^(n-x) * (n escolhe x) e E[X] = p*n
Distribuicao geometrica onde continuamos ate ter sucesso, X = tentativas:
    P(X = x) = (1-p)^(x-1) * p e E[X] = 1/p
```

```
Linearity of expectation: Tendo duas variaveis X e Y e constantes a e b, o valor esperado de aX + bY = a*E[X] + b*E[X]  
V(X) = E((X-u)^2)  
V(X) = E(X^2) - E(X^2)  
PG: al * (q^n - 1)/(q - 1)  
Mobius Inverse: Sum(d|n): mobius(d) = [n = 1] (expressao booleana)  
Soma dos cubos de l a N = a^2 onde a = somatorio de l a N  
Lindstrom-Gessel-Viennot: quantidade de caminhos disjuntos nas linhas do grid eh o determinante da matriz de qnts caminhos
```

8.3 Geometry

```
Formula de Euler: V - E + F = 2
Pick Theorem: Para achar pontos em coords inteiras num poligono Area = i + b/2 - 1
     onde i eh o o numero de pontos dentro do poligono e b de pontos no perimetro do
     poligono
Two ears theorem: Todo poligono simples com mais de 3 vertices tem pelo menos 2
     orelhas, vertices que podem ser removidos sem criar um crossing, remover orelhas
     repetidamente triangula o poligono
Incentro triangulo: (a(Xa, Ya) + b(Xb, Yb) + c(Xc, Yc))/(a+b+c) onde a = lado oposto
     ao vertice a, incentro eh onde cruzam as bissetrizes, eh o centro da
     circunferencia inscrita e eh equidistante aos lados
Delaunay Triangulation: Triangulacao onde nenhum ponto esta dentro de nenhum circulo
     circunscrito nos triangulos
Eh uma triangulacao que maximiza o menor angulo e a MST euclidiana de um conjunto de
     pontos eh um subconjunto da triangulacao
Brahmagupta's formula: Area cyclic quadrilateral
s = (a+b+c+d)/2
area = sgrt((s-a)*(s-b)*(s-c)*(s-d))
```

8.4 Dynamic Programming

 $d = 0 \Rightarrow area = sgrt((s-a)*(s-b)*(s-c)*s)$

```
Divide and conquer - dp[i][j] = mink < j(dp[i - 1][k] + C[k][j]} dividir o subsegmento ate j em i segmentos com custo, valido se A[i][j] <= A[i][j+1] Knuth - p[i][j] = mini < k < j{dp[i][k] + dp[k][j]} + C[i][j], valido se A[i, j - 1] <= A[i][j] <= A[i+1, j] onde A[i][j] eh o menor k que da a resposta otima slope trick - funcao piecewise linear convexa, descrita pelos pontos de mudanca de slope (multiset/heap) lembre que existe fft, cht, aliens trick e bitset
```

8.5 Mersenne's Primes

```
Primos de Mersenne 2^n - 1
Lista de Ns que resultam nos primeiros 41 primos de Mersenne:
2, 3; 5; 7; 13; 17; 19; 31; 61; 89; 107; 127; 521; 607; 1.279; 2.203; 2.281; 3.217;
4.253; 4.423; 9.689; 9.941; 11.213; 19,937; 21.701; 23.209; 44.497; 86.243;
110.503; 132.049; 216.091; 756.839; 859.433; 1.257.787; 1.398.269; 2.976.221;
3.021.377; 6.972.593; 13.466.917; 20.996.011; 24.036.583;
```
